

Proximal tibia resection / f / 16yo

♀ 16 yo

1st referral: 05.07.2012

HPI:

- Knee pain since July 2011
- No recovery after physiotherapy and orthopedic arch support
- Third consultation and increasing pain: MRI

PMH:

n.c.

Family history: grandmother breast cancer; grandfather lung cancer; uncle: lung cancer and gastric cancer

Proximal tibia resection / f / 16yo

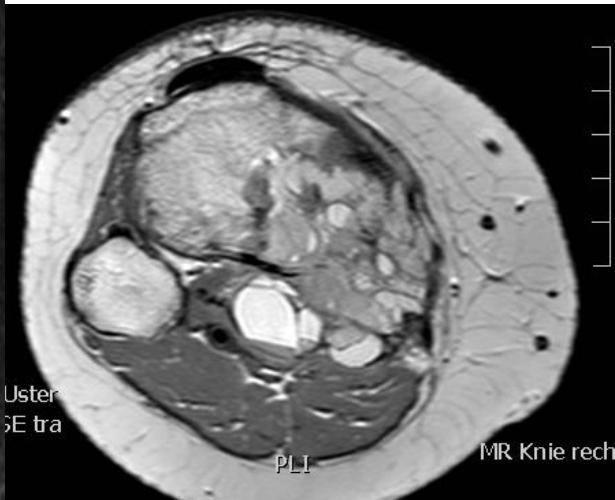

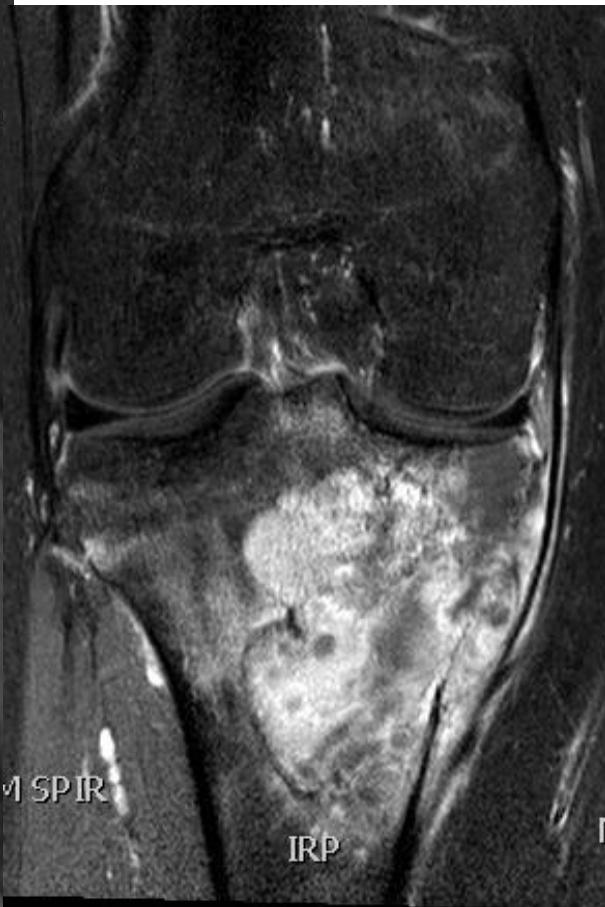

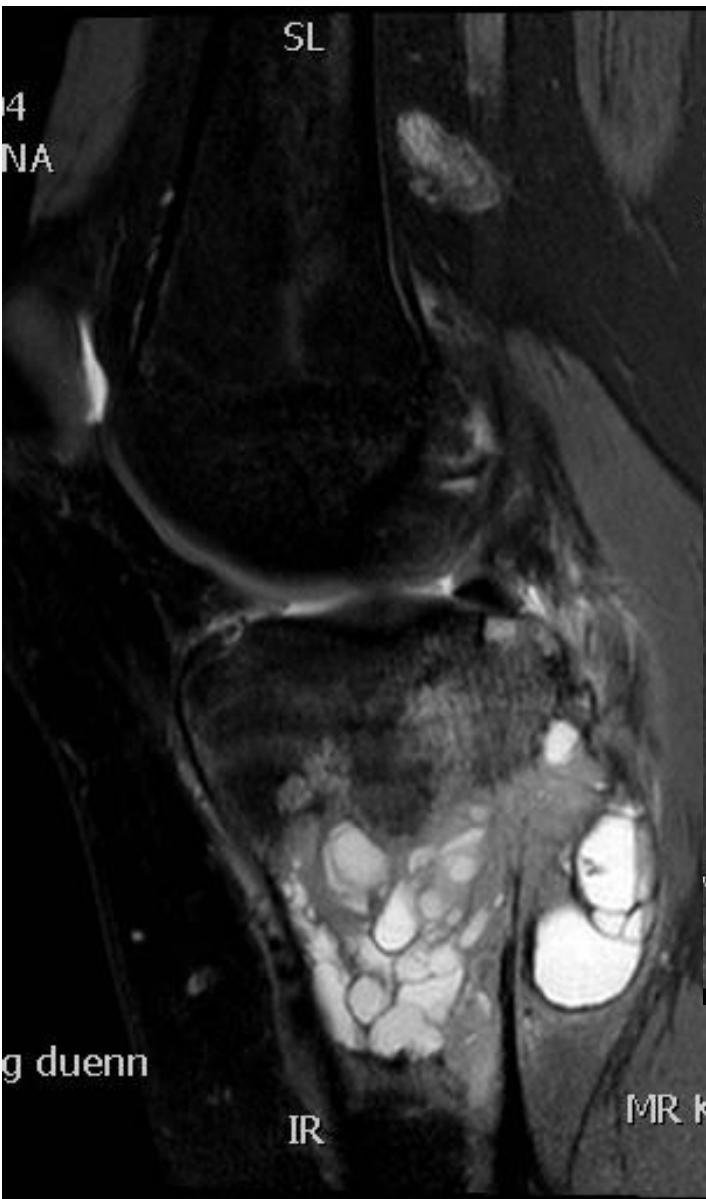

Clinical Exam:

Local swelling, warmth, F/E 140/0/0

Klinische Angaben

Verdacht auf Osteosarkom proximale Tibia rechts medial. Malignität?

67

Angaben zur Probe

Proximale Tibia rechts medial

Proximal tibia resection / f / 16yo

Diagnose

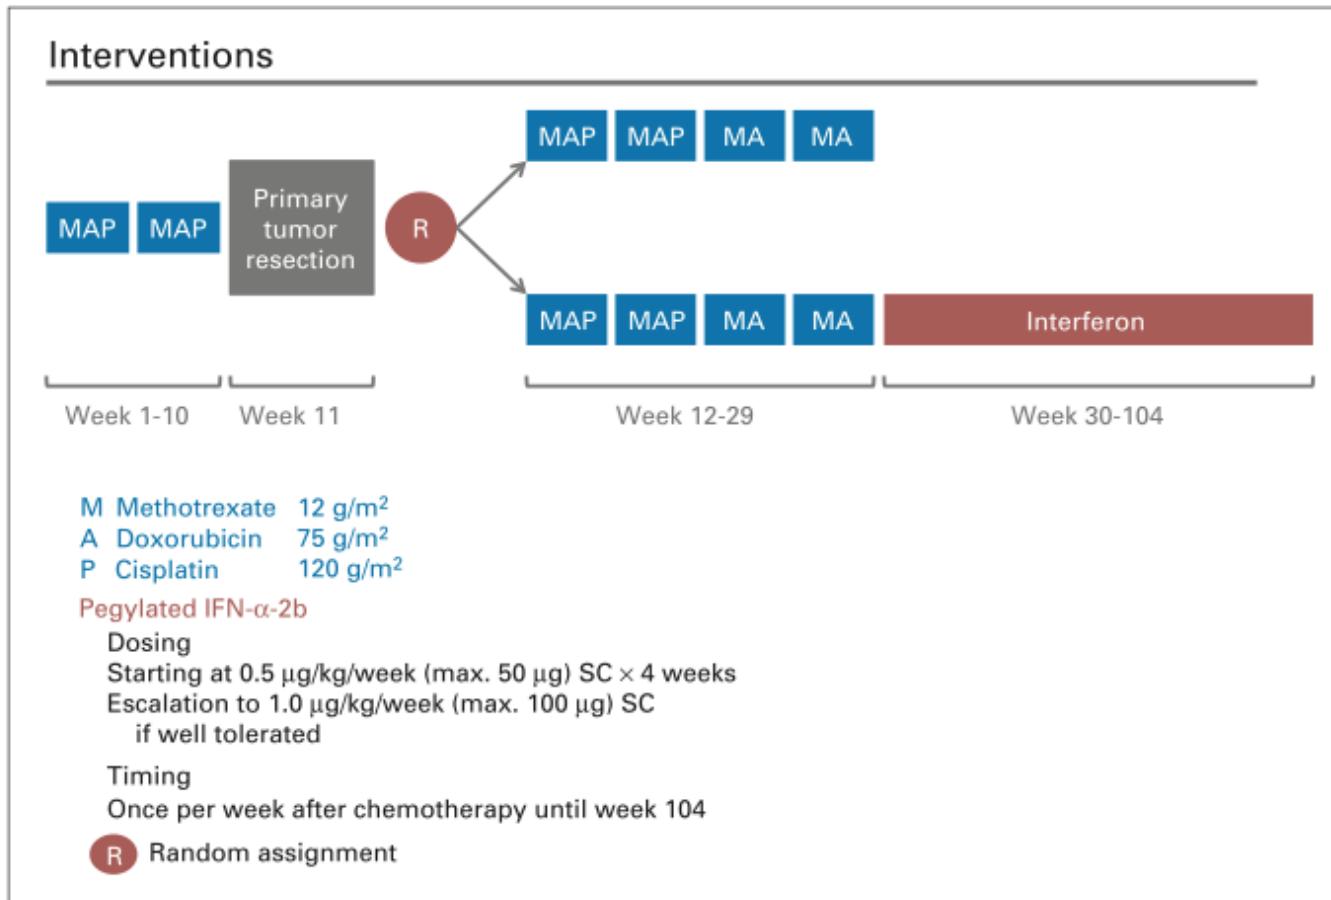

Anteile eines in der vorliegenden Probe überwiegend chondroblastischen, high grade, Osteosarkoms (proximale Tibia rechts medial).

Mikroskopischer Befund

Zahlreiche Biopsiefragmente, welche überwiegend aus solidem, sehr pleomorphem, spindelzelligem Tumorgewebe bestehen. Die Zellen sind zum Teil grotesk gross mit bizarr geformten, hyperchromen Kernen mit sehr unregelmässigem Chromatin und prominenten Nukleolen. Sehr viele, meist eindeutig atypische Mitosefiguren. Stellenweise xanthomatöse entzündliche Begleitreaktion. Die pleomorp-spindelige Tumorareale zeigen einen scharfen Übergang in Anteile mit läppchenförmig gewuchertem, chondromatösem Gewebe mit grundsätzlich niedriger Zelldichte aber deutlicher Pleomorphie und mitotischer Aktivität. Kleinherdig in den spindel- und pleomorphzelligen Abschnitten Ausbildung von nicht mineralisiertem Osteoid. Im miterfassten Knochengewebe Infiltration der Markräume. Höchstens kleinherdige Nekrosen (<5% der Schnittfläche der Probe) .

Diagnose

Proximales Tibiaresektat mit Fibulaanteil rechts (bei St.n. neoadjuvanter Chemotherapie): Überwiegend avitale Tumormasse des vordiagnostizierten chondroblastischen Osteosarkoms high grade mit einem max. Durchmesser von 6,5 cm.

Etwa 5% vitale Tumorbezirke (Tumoregressionsgrad III nach Salzer-Kuntschik).

Infiltration des dorsalen Weichgewebes ohne Nachweis von vitalen Tumorzellen im extraossären Anteil. Keine Infiltration der Gelenkfläche. Kein Nachweis einer Gefäßinvasion. Tumorfreie Hautspindel. Abstand zum ossären Resektrandr 4 cm. Mindestabstände zu den Weichteilresektaträndern allseits mindestens 1 cm.

Proximal tibia resection / f / 16yo

- Start of adjuvant chemotherapy in KiSpi
- CT of the lung is planned
- Follow-up's every 3 months

CLINICAL RESEARCH

Extensor Function After Medial Gastrocnemius Flap Reconstruction of the Proximal Tibia

Thorsten Jentzsch MD, Matthias Erschbamer MD, PhD,

Abstract

Background Reconstruction of the extensor mechanism after resection of the proximal tibia is challenging, and several methods are available. A medial gastrocnemius flap commonly is used, although it may be associated with an extensor lag. This problem also is encountered, although perhaps to a lesser extent, with other techniques for reconstruction of the extensor apparatus. It is not known how such lag develops with time and how it correlates with functional outcome.

Questions/purposes We therefore (1) assessed patellar height with time, (2) correlated patellar height with function using the Musculoskeletal Tumor Society (MSTS) score, and (3) correlated patellar height with range of motion (ROM) after medial gastrocnemius flap reconstruction.

Methods Sixteen patients underwent tumor endoprosthesis implantation and extensor apparatus reconstruction between 1997 and 2009 using a medial gastrocnemius flap after sarcoma resection of the proximal tibia. These patients

represented 100% of the population for whom we performed extensor mechanism reconstructions during that time. The minimum followup was 2 years (mean, 5 years; range, 2–11 years). Fourteen patients were alive at the time of this study. We used the Blackburne-Peel Index to follow patellar height radiographically with time. Functional outcomes were assessed retrospectively using the MSTS, and ROM was evaluated through active extensor lag and flexion.

Results Eleven patients had patella alta develop, whereby the maximal patellar height was reached after a mean of 2 years and then stabilized. More normal patellar height was associated with better functional scores, a smaller extensor lag, but less flexion; the mean extensor lag (and flexion) of patients with patella alta was 17° (and 94°) compared with only 4° (and 77°) without.

Conclusions In our patients patella alta evolved during the first 2 postoperative years. Patella alta is associated with extensor lag, greater flexion, and worse MSTS scores. Surgical fixation of the patellar tendon more distally to its anatomic position or strict postoperative bracing may be advisable.
