

Scapula; 3D precision partial resection

♀ 56 yo

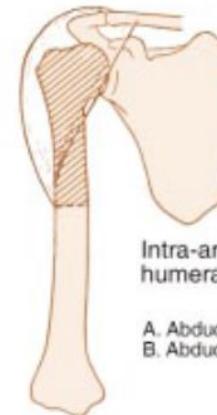

1st referral : 15.11.2006

HPI : longlasting pain in left shoulder (over-head use, sports, lying on left side), slowly growing infraclavicular tumor, new diminution of rotational strength

Referral after external x-ray follow-up

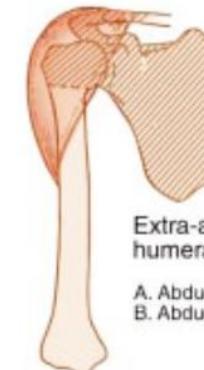

PMH : non contributory

axillary nerve?
intra- / transarticular?
level of OT & abductor?

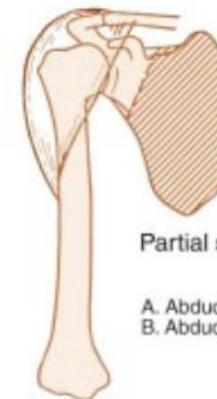

TYPE I

Intra-articular proximal humeral resection
A. Abductors retained (shown)
B. Abductors resected

TYPE IV

Extra-articular scapular and humeral head resection
A. Abductors retained
B. Abductors resected (shown)

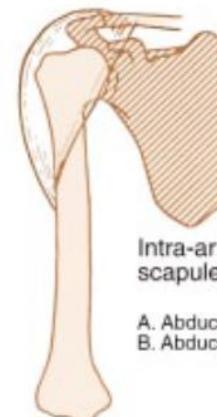

TYPE II

Partial scapulectomy
A. Abductors retained (shown)
B. Abductors resected

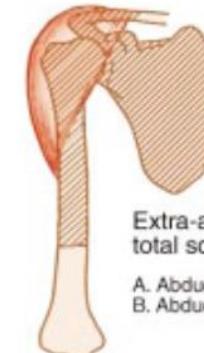

TYPE V

Extra-articular humeral and glenoid resection
A. Abductors retained
B. Abductors resected (shown)

TYPE III

Intra-articular total scapulectomy
A. Abductors retained (shown)
B. Abductors resected

TYPE VI

Extra-articular humeral and total scapula resection
A. Abductors retained
B. Abductors resected (shown)

Scapula; 3D precision partial resection

Nov 15, 2006

Clinical examination :

Big palpable non-tender infraclavicular tumor

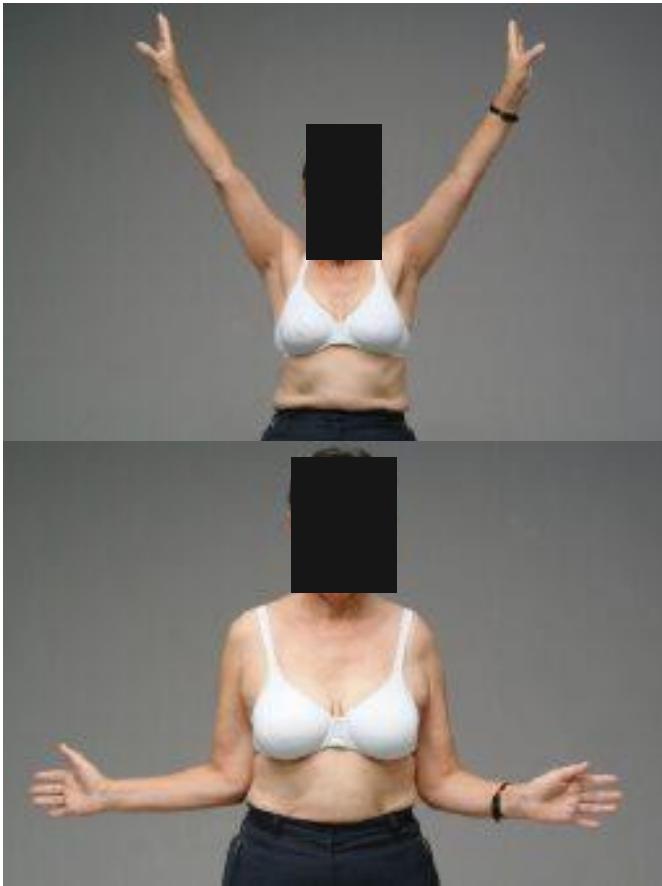

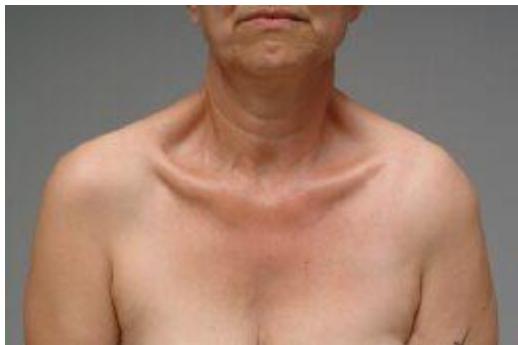

Reduced active external rotation

Reduced strength for external and internal rotation (M4)

Normal peripheral neurological status

Scapula; 3D precision partial resection

Scapula; 3D precision partial resection

Nov 15, 2006

X-ray : partially lytic, partially sclerotic, sharply delimited tumor (11.5x5.6cm) ventral scapula

Scapula; 3D precision partial resection

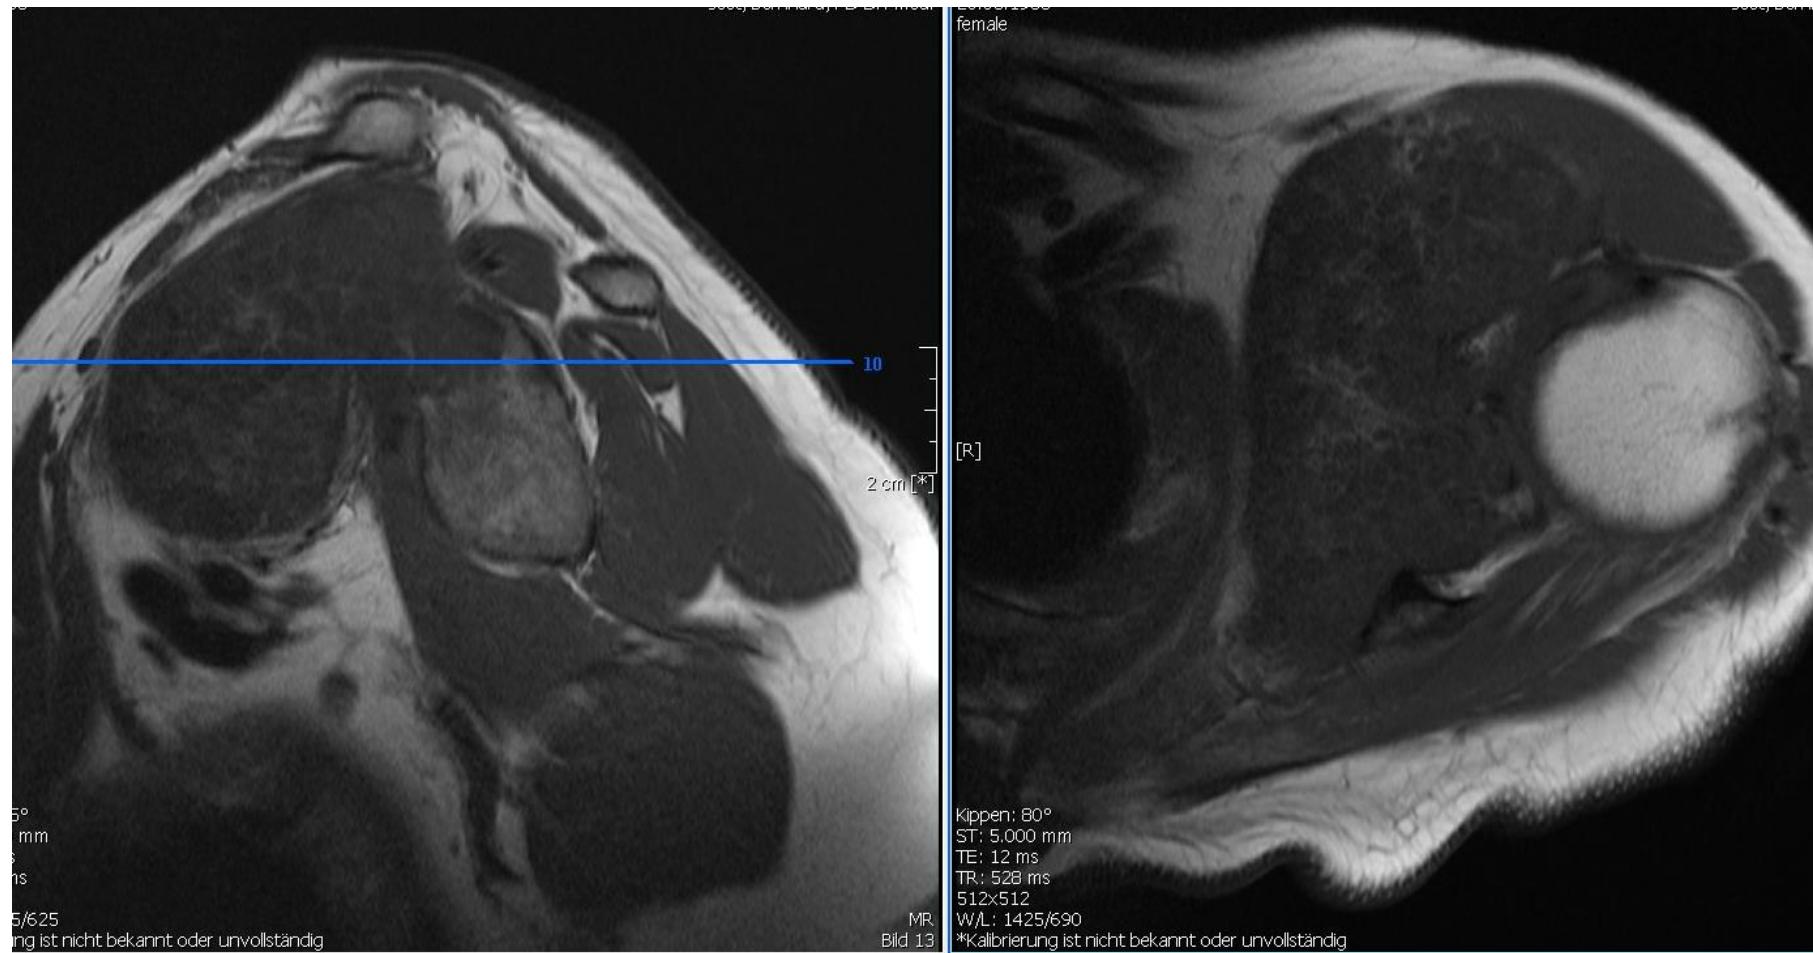

Oct 13, 2006

CT : partially lytic, partially sclerotic tumor based on ventral glenoid (coracoid)

Huge osteochondroma with mechanical symptoms

Decision for operative resection
(osteochondroma resection, tenodesis of long biceps in sulcus, tenodesis coracobiceps on anterior humeral metaphysis)

Scapula; 3D precision partial resection

Histology : USZ B2007:

Osteochondroma with parts of low-grade chondrosarcoma

Scapula; 3D precision partial resection

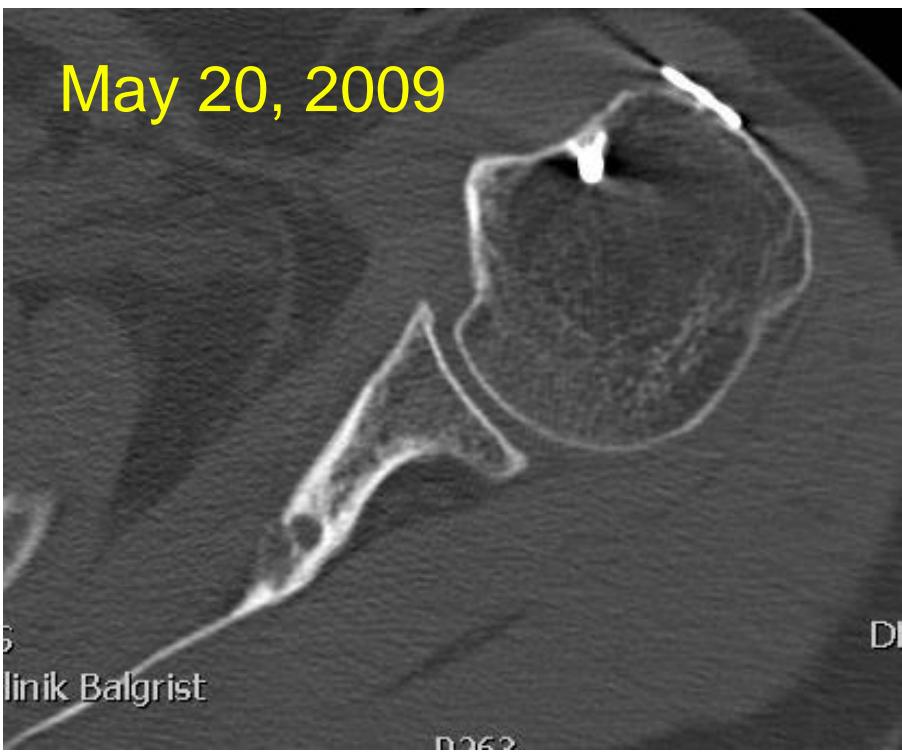

Current situation 2009:

After 2 y FU : good functional result, no pain

No local relapse, no metastasis (CT shoulder and CT thorax every 6 months)

Diagnose

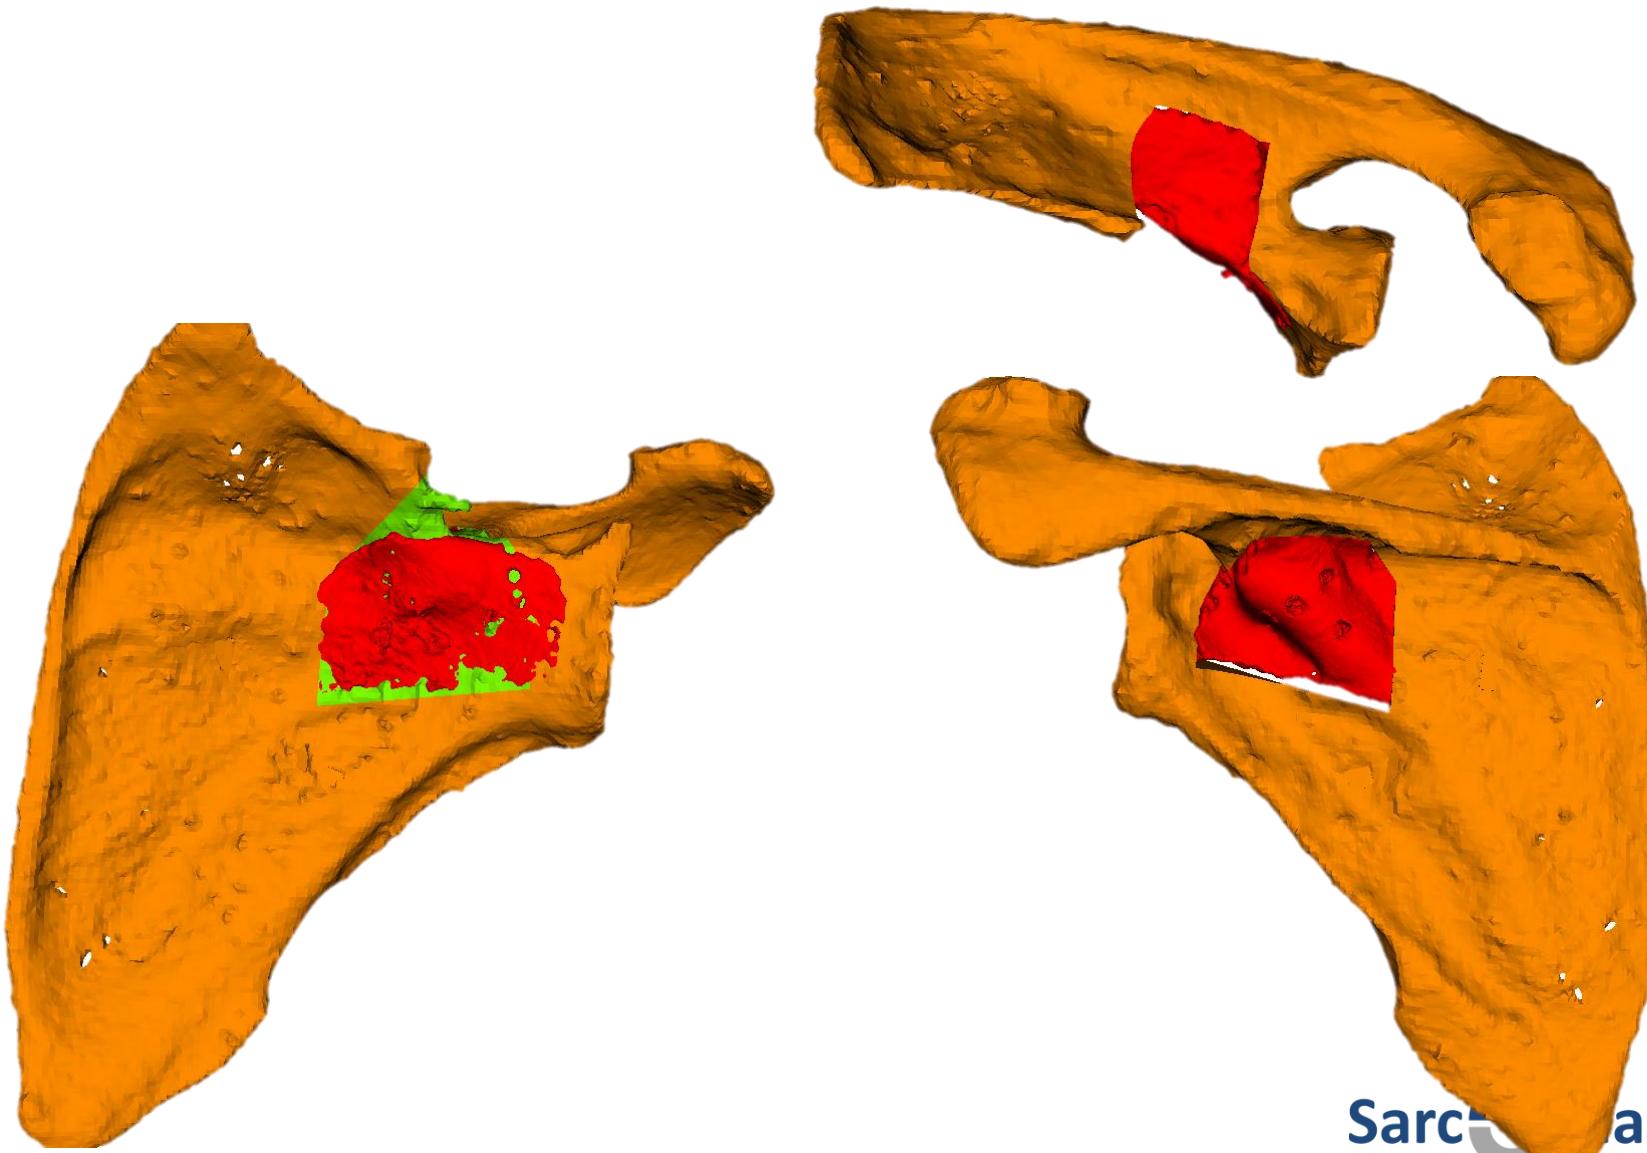

Knochenteilresektat (Skapula links, Glenoidhals) mit ausschliesslich intraossär gelegem Rezidiv des vordiagnostizierten (vgl. B 2007.16220) konventionellen Chondrosarkom (Malignitätsgrad G1), mit einer maximalen Tumorausdehnung von 4.2 cm. Keine Infiltration/ kein Durchbruch der Kortikalis.

Resektion im Gesunden.

Fragestellung:

Postoperative Nachbehandlung indiziert?

Therapeutische Entscheidungen:

Systemische Therapie:

Nein

Radiotherapie:

Nein

Hyprosar: Nein

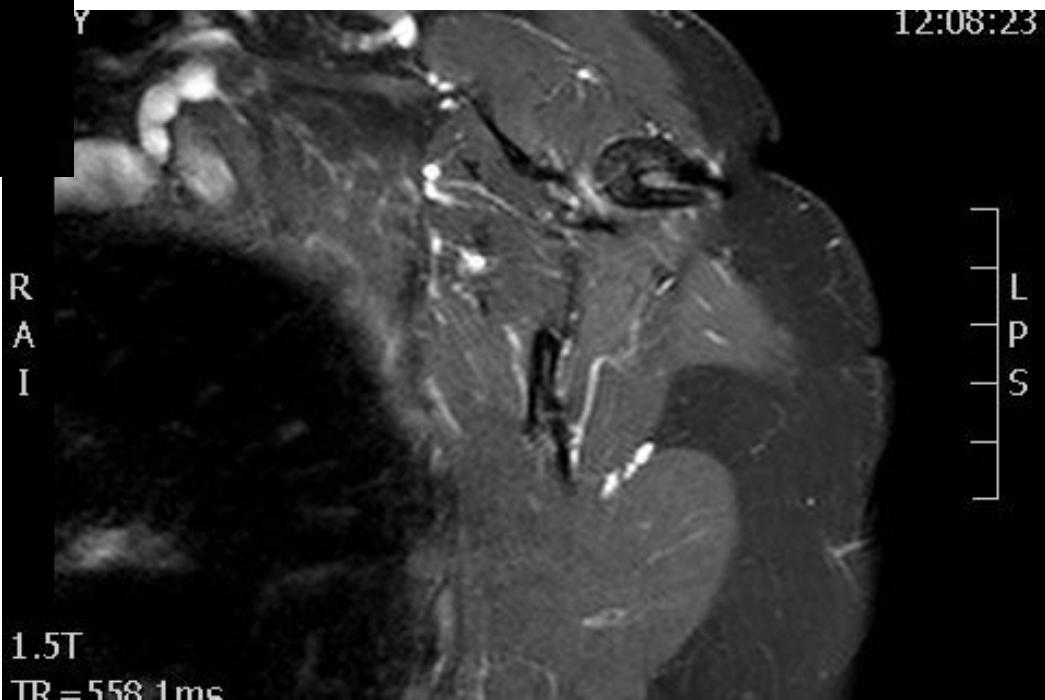

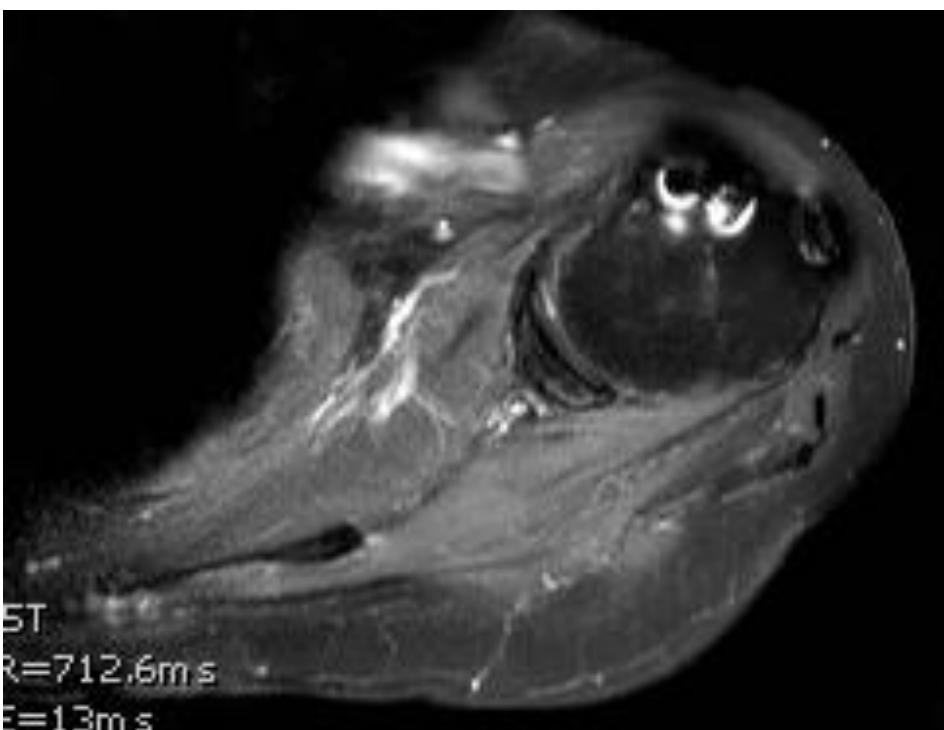

Chirurgie:

Bereits erfolgt

Organisatorisches:

Die Patientin wird für die Nachkontrollen in die Universitätsklinik Balgrist aufgeboten.
